## <u>BRACKETT</u>

## <u>YIELD</u>

- "Average" Hot Melt (HM) thickness: 10 mil. (.010 inches)
- Gallon of HM: 231 cubic inches
- > Hot Melt: 7.8 lbs. / gallon
- > Yield: 29.6 cubic inches / pound (231 divided by 7.8)
- > Spine length x width x mil thickness = total cubic inches.
- > 29.6 cubic inches divided by total cubic inches = total units per pound.
- Number of units (job size) divided by total units per pound = pounds of HM required.

## <u>COST</u>

- > Price per pound of HM divided by the total units = cost of hot melt per pad.
- Cost of hot melt per pound x number of pounds required = actual cost. (see "variables" below).
- Use this formula as a "guide" only. Variables of one type or another, can always impact your results.
- > YIELD variables, for example, include mil thickness and application temperature.
